No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                        2076

It can also be used to screen for a modulator of angiogenesis, chondrogenesis, oncogenesis, cell adhesion, cell migration, cell proliferation, expand a population of undifferentiated haematopoietic stem cells in culture and to screen for a mitogen (claimed). Ex vivo methods for using mammalian extracellular matrix signalling molecules to prepare blood products are also provided.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Isolated modulate

                                                                                                                                                                                                                   δÃ
                                                                                                                                                                                                                                                                                                                The invention relates to extracellular matrix (ECM) signalling molecules involved in cellular response to growth factors. More particularly the invention is directed to cysteine-rich protein (Cyr61), and Cyr61-related proteins such as fibroblast secreted protein (Fispl2) and connective tissue growth factor (CTGF) and connection seembers of cysteine-rich secreted protein family. Human Cyr61 fragment is useful in methods for screening modulators of cell adhesion, cell migration, fibroblast cell proliferation, angiogenesis, wound healing and Cyr61-integrin receptor interaction. Modulator of Cyr61-integrin alphavbeta3 interaction is used for the preparation of a medicament for the treatment of atherosclerosis, heart disease, tumour metastasis, fibroblast growth and wounds. Polynucleotides of the invention are useful in gene therapy. The present sequence is human Cyr61
                                                                                                                                                                                                                                                    Matches

MMDF can be used as an anti-cancer agent, an ir activator and to treat infectious diseases.
                                                                                                                                                                                                                                                                                                                                                        Sequence

DNA sequences, proteins useful in diagnosis and arteriosclerosis -
                                                                                                                                                                                                           The present invention provides the protein and coding sequences of number of human shear stress response proteins. These are useful in diagnosis, treatment and screening of vascular diseases caused by arteriosclerosis, including heart failure, post-PTCA restenosis and
                                                                                                                                                                                                                                                                               Claim 60; Page 345-346; 678pp; Japanese

The present invention relates to a method of inhibiting proliferation of uterine leiomyoma or preventing uterine leiomyoma formation. The method comprises increasing the level of Cyr61 in leiomyoma tissue. The invention also describes compounds and compositions that stimulate induction of the Cyr61 gene and compounds that increase Cyr61 activity. The compositions and the method of the invention are useful for the preventing uterine leiomyoma formation or inhibiting proliferation of the cyr61 gene and compounds that increase Cyr61 activity. The preventing uterine leiomyoma formation or inhibiting proliferation of the cyr61 gene and compound in a particularly useful for treating or preventing uterine leiomyoma formation, or inhibiting proliferation of the cyr61 gene method is particularly useful for treating or preventing uterine leiomyoma formation, or inhibiting proliferation of uterine leiomyoma in a subject. The present sequence is sequence or represents by the sequence shown in Fig 6 is not shown in the correct sequence order in the figures. The start of the sequence is shown on page 8/10 of the figures and the rest of the sequence is shown on the cyrest of 
                                                                                                                                                                                                                                                                                                                                                                                                  Preventing uterine leiomyoma formation or inhibiting proliferation of uterine leiomyoma in subject, comprises modulating or increasing the level of Cyr61 in leiomyoma tissue .

The method comprises administering a polynucleotide encoding connective tissue growth factor-2 (CTGF-2) or an active fragment or its derivative. The method is useful for stimulating angiogenesis in a mammu preferably human having ischaemia or restenosis or is treated for limb revascularisation which is leg or arm. The invention is useful for treascularisation which is leg or arm. The invention is useful for the contraction of the contra

                                 The present invention describes a method for the prevention or inhibition CC of breast cancer cell proliferation. The method comprises administration CC of a compound that inhibits the interaction of a sex steroid receptor with a sex steroid response element of the Cyr61 (cysteine rich heparin-CC which neutralises Cyr61 can be used to prevent or inhibit breast cancer CC cell proliferation by blocking sex steroid induced and growth factor induced synthesis of Cyr61 DNA, where the growth factor is epidermal, CC heparin binding epidermal or basic fibroblastic growth factor. (I) can be used to diagnose or stage breast cancer where the level of Cyr61 in a CC positive/suspect breast cancer cell is compared to the level in a CC normal tissue indicates the presence of breast cancer. The level of Cyr61 being determined by exposing the tissues to (I), and an increase in the level of breast cancer where the level of Cyr61 being determined by exposing the tissues to (I), and an increase in the level of cyr61 being determined by exposing the tissues to (I), and an increase in the level of cyr61 being determined by exposing the tissues to (I), and an increase in the level of cyr61 being determined by exposing the tissues to (I), and an increase in the level of cyr61 being determined by exposing the tissues to (I) and an increase in the level of cyr61 being determined by exposing the tissues to (I) and an increase in the level of cyr61 being determined by exposing the tissues to (I) and an increase in the level of cyr61 being determined by exposing the tissues to (I) and an increase in the level of cyr61 being determined by exposing the tissues to (I) and an increase in the level of cyr61 being determined by exposing the tissues to (I) and an increase in the level of cyr61 being determined by exposing the tissues to (I) and an increase in the level of cyr61 being the determined by exposing the tissues to (I) and an increase in the level of cyr61 being the determined by exposing the determined by exposing the determined by exp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁

AAC77607 to AAC78448 encode the human cancer associated proteins given CC in AAA43398 to AAB44239. The proteins can have activities based on the CC tissues and cells the genes are expressed in. Example of activities CC include: cytostatic; proliferative; vulnerary; immunomodulator; CC antidiabetic; antishmatic; antishmatic; antiarthritic; coaquiant; CC antidiabetic; antishmatic; antishmatic; antiarthritic; coaquiant; CC dermatological; neuroprotective; cardiant; thrombolytic; coaquiant; CC dermatological; neuroprotective; cardiant; thrombolytic; coaquiant; CC mootropic; vasotropic; antipsoriatic and antiangiogenic. The CC polynucleotides and polypeptides can be used for preventing, treating or CC ameliorating medical conditions and diagnosing pathological conditions. CC polynucleotides, polypeptides, antibodies, agonists and antagonists from CC immune cells, to treat disorders of haematopoietic cells, autoimmune CC disorders, allergic reactions, graft versus host disease and organ CC inflammation, cancers, cardiovascular disorders, neurological disease and CC inflammation, cancers, cardiovascular disorders, neurological disease and CC cancerial or viral infections. The peptides, nucleotides, antibodies, agonists and antagonists may be also be used in the exemplification of CC the present invention.

```
polypeptide, for treating or preventing a Novx-associated disorder (NoVI-8) and as a pharmaceutical composition comprising the polypeptide, copolynucleotide or the antibody. The polypeptides and polynucleotides are useful in diagnostic applications where their amounts are assessed, or for the manufacture of a medicament (e.g. gene therapy) for treating or preventing disorders or syndromes such as developmental disorders, immune diseases, signal transduction pathway disorders, metabolic disorders, feeding disorders (including obesity), wasting disorders, neurodegenerative disorders (including Alzheimer's disease and parkinson's disease), behavioural disorders, altergies, asthma, atheroselerosis, cardiomyopathy, angina pectoris, autoimmune disease, crithosis, diabetes, infectious disease (bacterial, fungal, protozoal and viral e.g. human immunodeficiency virus, HIV), cancer (e.g. prostate cancer), hypertension, hypotension, multiple sclerosis, urinary retention, osteoporosis, Crohn's disease, ulcers, may also be used as immunoders (e.g. anxiety), haemophilia or cirrhosis. They
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention discloses the isolated human polypeptides, and polypucleotides encoding them, that have been designated SECX and NOV. The polypeptides can be used for treating, or delaying, the onset of any logenic-associated disorder or treating a pathological state in a subject, preferably a mammal. They can also be used in determining the presence of, or predisposition to, a disease associated with altered levels of the polypeptides and polynucleotides of any one of the 12 sequences (SEC1-12), for raising antibodies, for identifying an agent that binds to, or that modulates the expression or activity of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Folkerts O,

SCGF has vulnerary and osteopathic activities, and can be used in gene therapy. The SCGF polypeptides and polynucleotides can be used for treating muscle wasting diseases, and osteoporosis, and to stimulate wound healing and tissue regeneration, to promote angiogenesis and to stimulate proliferation of vascular smooth muscle and endothelial cell production. The present sequence represents a CNN family protein which is given in comparison with the human SCGF in the exemplification of the
